<td>Symptoms at rest</td>
</tr>
<tr>
<td></td>
<td>• Unable to do any physical activity without discomfort</td>
</tr>
</tbody>
</table>

Heart failure is classified on a scale of I-IV based on the patients symptoms and ability to do activity or exercise. The functional class can get better or worse over time based on how the patient responds to treatment and how severe their symptoms are. Treatment for patient’s heart failure is based on their functional class.

Risk Factors

- Coronary artery disease
- Hypertension
- Diabetes Mellitus
- Alcohol or substance abuse
- Family history
- Atrial fibrillation
- Toxic exposure: including
  - Chemotherapy
  - Radiation
- Thyroid disease and other endocrinopathies

Conditions that may worsen heart failure
- Chronic obstructive pulmonary disease
- Kidney disease
- Moderate to severe sleep apnea
- Anemia
- Hypertension
Advance care planning

Discussion initiated early in the disease course and particularly when symptoms and/or functional status declines despite maximal medical therapy.

- Discussion about natural history of the disease and prognosis in all cases
- Address all precipitating factors: angina, hypertension, sodium and fluid restriction, adherence to medications, contributory conditions
- Ensure all active therapeutic options have been appropriately considered (ICD, biventricular pacing, revascularization, transplant)

Once the decision to initiate end-of-life care is made, the goal of therapy is to manage all symptoms (including those of comorbid conditions, e.g. chronic pain) and address function and quality of life issues.

Subsequent care should be based on the following principles

- Support of dying patients and their families
- Control of pain and symptoms (e.g. overload)
  - Consider choice and dose of narcotic as renal function is likely impaired – i.e. Hydromorphone for narcotic naïve, Duragesic patch.
  - Consider narcotic use with uncontrolled angina, or as a first-line for dyspnea
  - Consider home oxygen (See COPD Guideline for indications http://www.bcguidelines.ca/guideline_copd.html)
  - Adequate diuretic use (sometimes more than one agent) is important
  - ACE-I dose may need to be reduced if limited by symptomatic hypotension and renal impairment (Cr > 250 μmol/L or > 30% from baseline)
- Decisions on the use of life-sustaining therapies
Heart Failure Diagnostic Tests

Assessment of Left Ventricular Function
(Should be within 4 weeks of Heart Failure diagnosis)

2D Echocardiogram – allows assessment of left ventricular function as well as other cardiac structures
(repeat at end of treatment)

OR

MUGA – most accurate assessment - Left Ventricular Function + consider in patients with Atrial Fibrillation or who are overweight

OR

Perfusion Imaging (eg MIBI Scan) – provides information about both ischemia and Left Ventricular function
Other Heart Failure Diagnostic and Lab Tests

Chest XRay

ECG

Lab: Electrolytes, BUN, creatinine and eGFR
    TSH, FBS, CBC, INR
    Liver Enzymes (AST, ALT, Gamma GT)
    Consider Cholesterol, NT-proBNP or BNP
Non pharmacological

Heart Failure 101 Patient Information Handout

❤ Multidisciplinary HF care including specialized HF clinics where available
❤ Patient Education with focus on HF self management
  o Diet
    ▪ Low sodium diet (less than 2000mg per day)
    ▪ Fluid Restriction 6-8 glasses/day (1500-2000ml or 48-64 oz per day: IF on a diuretic such as Furosemide)
  o Activity (if stable HF, attempt regular aerobic and anaerobic activity OR consider referring to a cardiac rehabilitation program)
  o Smoking cessation counseling or referral to smoking cessation program where available
  o Daily weights
    ▪ Weight gain
      (No more that 4 lbs (2 kg) in 2 days or > 5 lbs (2.5 kg) in one week

❤ Immunizations
❤ Counseling for alcohol abstinence and substance abuse

Heart Failure Zones Patient Handout
Understanding Heart Failure
The Basics

How does the heart work?
Your heart is a muscle about the size of your fist. It works like a pump, pumping blood and nutrients around your body.

The heart is actually a 2-sided pump. The right side of the heart pumps ‘used’ blood from the body to the lungs. In the lungs, your blood is loaded up with oxygen. The left side of the heart pumps ‘fresh’ blood full of oxygen from the lungs to the rest of the body. The left side of the heart is usually the larger than the right. That is because it has to pump hard to get the blood out to all parts of your body.

Each side of the heart has 2 chambers. Valves link the chambers and keep blood pumping in the right direction. These valves open and close with each heartbeat.

What is Heart Failure?
Heart failure is when your heart is not pumping as strongly as it should. Your body does not get the right amount of blood, oxygen, and nutrients it needs to work properly.

Heart failure usually gets worse over time. While heart failure cannot be cured, people do learn to live active, healthy lives by managing their heart failure with medication, changes in their diet, weighing daily and physical activity.

There are two main types of heart failure:
• **A weak pump**: When the heart muscle is weak, it gets larger and ‘floppy’.
• **A stiff pump**: When the heart muscle cannot relax between beats because the muscle has become stiff. The heart cannot properly fill with blood between beats.

Both types of heart failure reduce the blood flow and oxygen to your body.
What causes Heart Failure?
Heart failure has many causes including:
• Heart attack
• High blood pressure
• Heart valve problems
• Heart defects at birth
• Lung conditions
• Excessive use of alcohol or drugs

Other possible causes of heart failure include:
• Obesity
• Sleep apnea
• Infections affecting the heart muscle
• Abnormal heart rhythm
• Severe anemia
• Severe kidney disease
• Overactive thyroid gland
• Exposure to chemotherapy or radiation

Not sure what caused your heart failure? Ask your doctor or nurse practitioner.

Signs of Heart Failure
You may notice any of the following signs.

- You feel short of breath when you do daily activities.
- You find it harder to breathe when resting or lying down.
- You wake up at night feeling short of breath.
- You find it easier to sleep by adding pillows or by sitting up in a chair.
- You cough often, especially when lying down.

- Your cough is either dry and hacking, or moist and you cough up mucus (which could be slightly pink).
- You feel your heart beat faster and it does not slow down when you rest.
- You feel your heart racing, jumping, or pounding in your chest.
- You cannot walk as far you normally can.
- You are tired all the time and have no energy to do daily activities.
- You feel lightheaded or dizzy, especially when you stand up or increase your activity and this is new for you.
- You cannot eat as much as you normally would.
- You are not hungry and do not feel like eating.
- You feel bloated or your clothes feel tighter than normal.
- You have swelling in your feet, ankles, legs, or even up into the belly (abdomen).
- Sudden increase in body weight where you gain more than 4 pounds (2 kilos) in 2 days.
- You feel uneasy, like something does not feel right.
- You feel confused and have trouble thinking clearly (and this is new for you).
Tests to identify heart failure

There is no single test for heart failure. Instead your doctor does a number of tests. The doctor looks at all the test results to determine if you have heart failure.

Tests can include:

- Blood tests to check certain enzymes
- Chest x-ray to look at the size of your heart
- Electrocardiogram (or ECG) to look at the electrical activity of the heart
- Exercise stress test to look at how your heart responds to exercise
- Nuclear medicine scan to get a close look at the pumping of your heart
- Angiogram to look for blockage in your heart arteries
- Echocardiogram or ultra sound of the heart to look at the movements of your heart and measure your ejection fraction

More about Ejection Fraction

This test is usually done during an echocardiogram or a nuclear medicine scan. Your ejection fraction can go up and down, depending on your heart condition and how well the treatment is working. It is good to know what your ejection fraction reading is. The reading is given as a percentage with normal being between 55 and 70%. Less than 55% means your heart is not pumping as strongly as it should be. Your ejection fraction helps your doctor or nurse treat your heart failure.

How is heart failure treated?

Look in the mirror - the key to treatment is YOU.

Your doctor relies on you to make changes in your lifestyle and eating habits. While there is a team of health care providers working with you to manage your heart failure, you are the one in charge.

Treatment is focused on helping you live a longer and healthier life. This includes:

- Monitoring your symptoms
- Reducing salt in your diet
- Increasing your daily activity through regular exercise
- Keeping your blood pressure low
- Maintaining a healthy weight
- Stopping unhealthy habits such as smoking
- Taking your medications as prescribed

For some people, surgery and medical devices are needed to treat the problem that led to the heart failure. Treatments could include:

- Coronary bypass surgery
- Valve repair or replacement surgery
- Implanted device such as a pacemaker and/or defibrillator
- Mechanical device to help the heart pump
- Heart transplant

For novel new ideas on heart failure treatment consult your health care provider.
Plan today for the future

Your heart failure may get worse over time. Start thinking now about how you wish to be cared for if your disease progresses. This is called ‘advanced care planning’. Advance care planning allows you to have a say in your health care if you are unable to speak for yourself.

Talk to your family and your doctor about helping you live well with heart failure and about the care you do or do not want in the future.

Things to think about and consider:

- What does it mean to live well with heart failure?
- What is important to you to make your life the best it can be?
- What is important to you as your condition progresses?
- What worries and concerns do you have?
- How will your progressing heart failure affect you and your family?
- Who or what gives you support when you need it?
- If you are not able to make your own health care decisions, who will you want to make them for you? Does that person know what you want?
- Do you have written instructions for how you want to be cared for if you cannot make decisions for yourself (this is called an advance directive).

Why learn to manage your heart failure?

When you take charge of your health and learn to manage your heart failure, it helps you:

- Improve the quality of your life.
- Feel confident that you can manage your heart failure.
- Control your condition so it will not control you.
- Know when to ask for help from your care team.
- Limit the need to go to the hospital for care.
- Prevent or limit heart failure complications as the disease progresses.

Talk with your family and your care team about your disease and care plan. People who learn to manage their heart failure are more likely to live a longer, healthier life than those who do not.

Heart Failure Zones

Check Weight Daily

- Weigh yourself in the morning before breakfast. Write it down.
- Compare your weight today to your weight yesterday.
- Keep the total amount of fluids you drink to only 6 to 8 glasses each day.
  (6-8 glasses equals 1500-2000 mL or 48-64 oz)
- Take your medicine exactly how your doctor said.
- Check for swelling in your feet, ankles, legs, and stomach.
- Eat foods that are low in salt or salt-free.
- Balance activity and rest periods.

Which Heart Failure Zone Are You Today?  Green, Yellow, or Red

ALL CLEAR – This zone is your goal!
Your symptoms are under control.
You have:
- No weight gain of more than 4 lbs (2 kg) in 2 days.
- No shortness of breath.
- No swelling or increase in swelling of your feet, ankles, legs, or stomach.
- No chest discomfort, pressure, or pain.

CAUTION – This zone is a warning
Call your doctor’s office if you have any of the following:
- You gain more than 4 lbs (2 kg) in 2 days.
- You feel more short of breath than usual.
- You have increased swelling in your feet, ankles, legs, or stomach.
- You have a dry hacking cough.
- You feel more tired and don’t have the energy to do daily activities.
- You feel lightheaded or dizzy, and this is new for you.
- You feel uneasy, like something does not feel right.
- You find it harder for you to breathe when you are lying down.
- You find it easier to sleep by adding pillows or sitting up in a chair.

Doctor’s Name ____________________________ Office Phone Number ____________

EMERGENCY – This zone means act fast
Go to emergency room or call 9-1-1 if you have any of the following:
- You are struggling to breathe.
- Your shortness of breath does not go away while sitting still.
- You have a fast heartbeat that does not slow down when you rest.
- You have chest pain that does not go away with rest or with medicine.
- You are having trouble thinking clearly or are feeling confused.

Updated: January 2012. For more information on heart failure, go to www.bcheartfailure.ca.
The information in this document is intended solely for the person to whom it was given by the healthcare team.
Limiting Sodium (Salt)  
When You Have Heart Failure

Sodium is a mineral found in food, table salt, and sea salt. Your body needs some sodium, but too much sodium causes your body to hold on to (or retain) fluid. This fluid build-up makes your heart work harder. The fluid build-up can cause swelling in your feet, legs, or belly. Fluid can also build up in your lungs, making it hard for you to breathe.

If your weight increases by more than 2 kg (4 lb) in two days, or 2.5 kg (5 lb) in 1 week, you are retaining fluid. If this happens, you should call your health care provider right away.

You should restrict the amount of sodium you eat to 2000mg or less each day.

In the average Canadian diet, where does sodium come from?

- In ready-made processed foods and restaurant meals (77%)
- Naturally occurring in food (12%)
- Added to food in cooking and at the table (11%)

How to avoid salt (sodium)?

- Eat fresh foods most of the time and prepare home-cooked, low sodium meals.

- Frozen foods are acceptable if they do not have added salt or sodium additives (which are used as preservatives).

- Remove the salt shaker from the table. Don’t add salt, flavoured salts or seasonings high in salt to your foods.

  One teaspoon of salt contains 2300mg of sodium!

- Season your food with herbs, spices, lemon juice, dry mustard, and garlic. Try one of the many seasoning blends which contain no salt such as Mrs. Dash.

- Stay away from eating:
  - processed foods
  - deli meats
  - pickled foods
  - salted snack foods such as potato chips, pretzels, dips, and salted nuts

- Limit the amount of canned foods you eat. Choose products labelled ‘low sodium’. Foods labelled ‘lower’, ‘less’ or ‘reduced in salt or sodium’ may still be high in sodium (including soups and meats).

- Eat out less often.
  - Ask restaurants to provide information on low sodium choices.
  - Restaurant meals and fast foods are always higher in salt than home cooked low sodium meals.
  - For more info, please refer to Low Sodium (Salt) Eating Out fact sheet at www.healthlinkbc.ca (or click here).
Can I use Salt Substitutes?

Some salt substitutes use potassium instead of sodium. Check with your doctor or dietitian before using a salt substitute because some people need to limit how much potassium they have each day.

Keep your sodium intake to less than 2000mg each day.
As you gradually reduce the amount of salt you are eating, your taste buds will adjust!

How do I know how much sodium is in food?

Here are some helpful tips when reading the nutrition label:

- Look at the serving size – the amount of sodium listed is per serving (not the whole package).
- Keep track of the total amount of sodium you eat. Remember: Your maximum recommended daily amount of sodium is no more than 2000mg per day from all sources.
- Keep the sodium content of each meal below 650mg – this helps spread out your sodium intake over the day preventing excessive thirst and/or fluid retention.
- By law, foods labelled ‘low sodium’ must contain 140mg or less per serving.

Other ingredients high in sodium include: baking soda, brine, monosodium glutamate (MSG), soy sauce, fish sauce, garlic salt, celery salt, or any ingredient with ‘sodium’ as part of its name.

The information in this document is intended solely for the person to whom it was given by the healthcare team.
Daily Weight Information

Patient Name: ____________________________  Heart Function Clinic or Physician’s office: ________________

Health Care Provider: ________________________  Contact phone number: ____________________________

Check Your Weight Every Day

Why:

- Checking your weight every day lets you know if your body is retaining fluid.
- Excess fluid build up in your body makes your heart work harder.
- When you report weight gain early to your health care provider, they can help you prevent your heart failure from getting worse. This can help prevent a hospital admission.

If your weight increases by:

- More than 2 kg (4 lb) in two days, or  You are retaining fluid.
- More than 2.5 kg (5 lb) in 1 week  You should call your health care provider.

For further directions, please refer to ‘Heart Failure Zones’ information sheet.

When:

- Same time every day
- Preferably before breakfast

How:

- After you have emptied your bladder (gone 'pee')
- Wear the same amount of clothing

Record your weight in the attached calendar.

(or You may prefer to use your own method such as a notebook, a computer.)

Remember to bring your record to your doctor or clinic appointment.

Updated: January 2012. For more information on heart failure, go to www.bcheartfailure.ca.

The information in this document is intended solely for the person to whom it was given by the healthcare team.
Your ‘Dry Weight’ (when you don’t have excess fluid in your body):  _________________

Write down your weight each day compare today’s weight to yesterdays weight.
If your weight increases by:

- More than 2 kg (4 lb) in two days, or  You are retaining fluid.
- More than 2.5 kg (5 lb) in 1 week  You should call your health care provider.

Limiting Fluid
When You Have Heart Failure

What is a fluid?
Any food or drink that is liquid at room temperature. This includes water, ice, milk, juices, soft drinks, hot drinks, alcohol, soups, gelatin desserts, ice cream, popsicles, and liquid nutrition supplements (such as Ensure or Boost).

Why do you have to limit fluid?
When you have heart failure, fluid can build up causing swelling in your feet, legs or belly making your heart work harder. Fluid can also build up in your lungs, which may cause you to have trouble breathing.

How much fluid can you have in a day?
You should have no more than 1.5 to 2 litres of fluid in a day. You may find you are thirsty to begin with. As you gradually reduce your fluid intake, your body will adjust!

Guide to Fluid Measures

<table>
<thead>
<tr>
<th>Amount</th>
<th>ml</th>
<th>ounce</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 tablespoons</td>
<td>30 ml</td>
<td>1</td>
</tr>
<tr>
<td>1 glass</td>
<td>250 ml</td>
<td>8</td>
</tr>
<tr>
<td>1 pint</td>
<td>500 ml</td>
<td>16</td>
</tr>
<tr>
<td>1 litre or 1 quart</td>
<td>1000 ml</td>
<td>32</td>
</tr>
<tr>
<td>2 litres</td>
<td>2000 ml</td>
<td>64</td>
</tr>
</tbody>
</table>

Total amount of fluid per day
1.5-2 litres = 48-64 ounces = 6-8 glasses

How do you know when you have too much fluid?
To keep track of whether your body is holding on to too much fluid, weigh yourself daily.

Here is how to weigh yourself:
❤️ Weigh yourself at the same time every day. The best time is first thing in the morning.
❤️ Weigh yourself after emptying your bladder (gone pee).
❤️ Wear the same amount of clothing each time.

You are holding on to too much fluid when:
- Your weight increases by more than 2 kg or 4 lb in two days.
- Your weight increases by more than 2.5 kg or 5 lb in a week.

Contact your health care provider right away if you are holding too much fluid.

Tips for reducing your fluid intake
❤️ Use smaller cups and glasses.
❤️ Measure the amount of fluid your mugs and glasses hold. They may measure more than 250 ml or 8 ounces!
❤️ Sip your fluids slowly.
❤️ Write down the amount you drink each day until limiting your fluid becomes a habit.

(More tips on page 2.)
More tips for reducing your fluid intake

- Sip your fluids throughout the day. Keeping track of fluids is the only way to learn how to make the 1.5 to 2 litres of fluid last you through the day.
- You may find it easier to use a reusable water bottle. Measure how much the bottle holds so you know exactly how much water you are drinking.
- Drain the fluid from canned fruit.
- Be aware of foods with high water content like watermelon, yogurt, and pudding.
- If you can, swallow your pills with soft food like yogurt or porridge.
- Limit the amount of sodium you eat to 2000mg or less each day. Salt will make you thirsty. For more information, refer to the handout Limiting salt (sodium) when you have heart failure.
- Try not to eat sweet foods. They can make you thirsty. If you have diabetes, controlling your blood sugar also helps control your thirst.
- Try not to drink alcohol. Alcohol dehydrates your body and makes you thirsty.

Tips to deal with thirst

- Rinse your mouth with water often, but do not swallow.
- Brush your teeth often.
- Use a mouth wash. However, do not use a mouthwash that contains alcohol. They tend to dry out your mouth.
- Snack on a small piece of cold or frozen fruit such as a frozen grape or cold orange slice. Try cold crisp vegetables too.
- Chew sugar-free gum.
- Suck on a lemon wedge, lemon candy, or sour candy.
- Use lip balm to keep your lips from drying out.
- Don’t overheat your home. Consider using a humidifier to increase the moisture in the air.
- Ask your pharmacist about gels or sprays that can add moisture to your mouth.

For more tips and resources for limiting fluid, call HealthLink BC (dial 8-1-1) to speak to a health care professional. You can also refer to www.healthlinkbc.ca (or click here).
Why People with Heart Failure Should Keep ‘Active’

What does it mean to be ‘active’?
Activity and exercise - People often use these two terms to mean the same thing. All physical activities and exercise do involve increasing the heart rate and strengthening muscles.

There is, however, a small difference in their meanings. Physical activity is when you are using energy to move your body to get from place to place. Exercise is a type of physical activity. The difference is - exercise is planned. We exercise to improve or maintain fitness or health.

Why activity is important
Keeping active is one of the best ways to keep healthy. Any amount of activity is better than none at all.

Keeping active helps you:
- Sleep better
- Feel less tired
- Feel less breathless
- Feel more confident and in control

Studies show that daily activity is good for you. It can help you to live better and longer.

Is the activity level right for me?
Get to know your body. It is important that you feel comfortable doing the activity.

As long as you can talk without being too short of breath the level of activity is okay.

Balance activity and rest
- Be active at a time when you feel rested, such as first thing in the morning or after nap.
- Choose which activities to do each day.
- Spread your activities throughout your day.
- If you are tired after an activity or the next day, then you have tried to do too much.
- It may take your body a while to find a balance between activity and rest, so don’t give up.

Activities most people with heart failure can do
- Walking
- Light housework
- Gardening
- Light vacuuming
- Stretching
- Laundry
- Grocery shopping

Getting started
- Always check with your health care provider first before starting an activity to make sure you find an activity that matches your personal needs and ability.
- Start off slowly and pace yourself.
When to stop an activity

Stop the activity if you:
- Cannot carry on a conversation, sing, or whistle without being short of breath.
- Feel weak, tired, or dizzy.
- Feel sick to your stomach (nauseated).
- Feel your heart is pounding or racing.
- Feel your heart beating irregularly and this is new for you.
- Have pain in your chest, neck, jaw, arm, or shoulder.

Stop and rest. Sit in a comfortable chair. Do not go to bed for a nap.

Activity most people with heart failure should not do

- Activities that involve working above your head such as painting or washing walls, washing windows, vacuuming curtains.
- Lifting or pushing heavy objects.
- Straining or holding your breath to do an activity.
- Sit ups or push ups.
- Climbing a lot of stairs.
- Heavy housework or yard work.
- Going into sauna or hot tub.

Tips about activity

- Stick with it, so it becomes a habit.
- Include a variety of different activities so you do not get bored doing the same thing all the time.
- Wear loose, comfortable clothing and supportive shoes.
- Count the fluids you drink during the activity as part of your daily fluid amount.

What if you don’t feel confident doing activities and exercises on your own?

There are many community-based programs designed specifically for people with heart disease.

To find a program in your community:
- Talk to your health care provider
- Call HealthLink BC at 8-1-1
- Go to the HealthLink BC website (www.healthlinkbc.ca).
  - Click on the ‘Find’ button.
  - Type in ‘cardiac rehabilitation’ in the ‘What?’ box.
  - Type in your location in the ‘Where?’ box.
  - Click the ‘Go’ button.
  - Choose a program.
- Contact the Physical Activity Line (PAL)
  - 1-877-725-1149
  - www.physicalactivityline.com
  - info@physicalactivityline.com

Learn more about how important activity is

Review the ‘Actionset’ called ‘Heart Failure: Activity and Exercise’ on the HealthLink BC web site.
www.healthlinkbc.ca/kb/content/actionset/aa87369.html

Check the BC Heart Failure Network web site.

Confirm Systolic Dysfunction

LVEF < 40%

Wet or Dry?

Start Beta blocker
Carvedilol

Pre-existing Renal Disease?

ACE Tolerated?

Try ARB

Titrate to max tolerated or target dose

ACE Inhibitor +
Furosemide 40mg

Start Beta Blocker: Carvedilol

Confirm Systolic Dysfunction LVEF < 40%

Treatment if LVEF > 40%

COPD ?

HTN ?

Start ACE 2 wks after optimal Beta Blocker

Reassess NYHA I or II

If now Dry

Consider Hydralazine + Isosorbide Dinitrate

Start Beta Blocker: Carvedilol

Stop ACE, ARB

Creatinine Rising >30%

End of Life Care

Eligibility for ICD/CRT

NYHA Func Class getting worse (III or IV)

Refer Cardiologist, Internist or HF Clinic

OR depending on renal function can add/start Spironolactone 25 mg daily and titrate

Consider starting Digoxin 0.0625-0.125 mg once per day (target < 1.0 ng/mL)

Assess need for diuretic each visit – taper whenever symptoms suggest NYHA Classification at each visit

Assess need for diuretic each visit – taper whenever symptoms suggest NYHA Classification at each visit

With each medication dosage change and prior to each office visit -> Continue to monitor symptoms, lytes, and educate regarding diet, medication compliance, daily wts, avoiding NSAIDs, etc

BC’s HEART FAILURE NETWORK
Quality care for quality life.
Management of patient with Preserved Left Ventricular Ejection Fraction (EF > 40%)

Diuretic Titration

At present there are no medication therapies with mortality benefit in patients who have heart failure with preserved ejection fraction (EF >40%)

1. **ACE Inhibitors** (Evidence: PEP CHF trial, 2006)
   a. **Perindopril**: has been shown to decrease hospitalization in older patients
      i. Consider its usage if hypertension is present

2. **ARB** (Evidence: CHARM preserved trail, 2003 & LIFE trail, 2002)
   a. **Candesartan**: has a moderate impact in preventing hospital admission for HF patients with a LVEF > 40%.
   b. **Losartan**: has been shown to decrease L+ ventricular hypertrophy (LVH)
      i. Consider in patients with hypertension and LVH

3. **Beta Blockers** (Evidence: no clinical trial)
   a. Physiologically beta blockers may be advantageous given that they decrease heart rate and improve diastolic filling time
      i. Consider BB in patients with atrial fibrillation or increased heart rate in the absence of conduction system disease (eg. 1st degree block, 2nd degree, 3rd degree)
### Commonly used Diuretics

<table>
<thead>
<tr>
<th>Drug</th>
<th>Starting dose</th>
<th>Maximum total daily dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Furosemide</td>
<td>20 mg – 40 mg daily or BID</td>
<td>600 mg</td>
</tr>
<tr>
<td>Bumetanide</td>
<td>0.5 mg – 1 mg daily or BID</td>
<td>10 mg</td>
</tr>
<tr>
<td>Ethacrynic acid</td>
<td>25 mg – 50 mg daily or BID</td>
<td>400 mg</td>
</tr>
<tr>
<td>Metolazone</td>
<td>2.5 mg once daily</td>
<td>20 mg</td>
</tr>
</tbody>
</table>

### Beta blocker with Evidence in Heart Failure Populations

<table>
<thead>
<tr>
<th>Drug</th>
<th>Starting Dose</th>
<th>Maximum total daily Dose</th>

<tr>
<td></td>
<td></td>
<td>&gt;85 kg: 50mg BID</td>
</tr>
<tr>
<td>Metoprolol</td>
<td>12.5mg BID</td>
<td>100mg BID (when reached, consider change to SR)</td>
</tr>
<tr>
<td>Bisoprolol</td>
<td>1.25mg once daily</td>
<td>10mg OD at hs</td>
</tr>
</tbody>
</table>

### Commonly used Angiotensin Converting Enzyme Inhibitor (ACE-I)

<table>
<thead>
<tr>
<th>Drug</th>
<th>Starting Dose</th>
<th>Target Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Captopril (Capoten)</td>
<td>6.25 mg-12.5 mg TID</td>
<td>25-50 mg TID</td>
</tr>
<tr>
<td>Enalapril (Vasotec)</td>
<td>1.25 mg-2.5 mg BID</td>
<td>10 mg BID</td>
</tr>
<tr>
<td>Perindopril (Coversyl)</td>
<td>2 mg once daily</td>
<td>4-8 mg once daily (24 hr dosing)</td>
</tr>
<tr>
<td>Ramipril (Altace)</td>
<td>1.25-2.5 mg BID</td>
<td>5 mg BID</td>
</tr>
<tr>
<td>Trandolapril (Mavik)</td>
<td>1 mg once daily</td>
<td>4 mg once daily</td>
</tr>
</tbody>
</table>

### Commonly used ARBS (if unable to tolerate ACE’s)

<table>
<thead>
<tr>
<th>Drug</th>
<th>Starting doses</th>
<th>Target dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Candesartan</td>
<td>4 mg once daily</td>
<td>32 mg once daily</td>
</tr>
<tr>
<td>Valsartan</td>
<td>40 mg BID</td>
<td>160 mg BID</td>
</tr>
</tbody>
</table>

### Commonly used Aldosterone Antagonists

<table>
<thead>
<tr>
<th>Drug</th>
<th>Starting dose</th>
<th>Maximum total daily dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spironolactone</td>
<td>12.5mg-25mg</td>
<td>25 daily</td>
</tr>
<tr>
<td>Eplerenone (not covered by MSP)</td>
<td>25 mg daily</td>
<td>50 mg daily (Within 4 weeks of starting the dose)</td>
</tr>
</tbody>
</table>
### Hemodynamic Subtypes of Heart Failure

<table>
<thead>
<tr>
<th>Warm and dry</th>
<th>Cold and dry</th>
<th>Warm and wet (common)</th>
<th>Cold and wet</th>
</tr>
</thead>
</table>
| Adequate perfusion, no congestion  
  • Normal pulmonary capillary wedge pressure (PCWP)  
  • Normal cardiac index (CI)  
  • No signs or symptoms | Poor perfusion, without congestion  
  • Low or normal PCWP  
  • Decreased CI  
  • Signs and symptoms:  
    ▪ adventitious breath sounds,  
    ▪ leg swelling, ascites,  
    ▪ decreased peripheral perfusion | Normal perfusion with congestion  
  • Elevated PCWP  
  • Normal CI  
  • Signs and symptoms:  
    ▪ dyspnea  
    ▪ leg swelling | Poor perfusion with congestion  
  • Elevated PCWP  
  • Decreased CI  
  • Signs and symptoms:  
    ▪ Altered mental status, decreased  
    ▪ oxygen saturation,  
    ▪ reduced urine output  
    ▪ possibly other indicators of cardiogenic shock |

#### Management
- **Warm and dry**
  - *This is the target profile*
  - *Emphasis on titration of chronic therapy to optimal doses*
- **Cold and dry**
  - 2 Distinguish from hypovolemic shock.
  - *Emphasis on inotropic and mechanical support*
  - Hemodynamic monitoring required
  - Cautious filling if CXR clear
- **Warm and wet (common)**
  - *Emphasis on diuretic therapy with addition of vasodilators*
  - Significant diuresis may be required
  - B-blockers can be continued BUT NOT initiated
- **Cold and wet**
  - *Emphasis on vasodilator therapy and diuresis*
  - B-blockers and ACE inhibitors may need temporary withdrawal

Commonly used Diuretics

<table>

</table>

If pre-existing renal dysfunction consider starting with higher dose of diuretic

Diuretic Up Titration & Intervention Guidelines

Perform telephone or in clinic assessment of fluid status 3-4 days after medication changes, and check blood work within 7-10 days after medication changes

<table>
<thead>
<tr>
<th>Signs and Symptoms Assessment</th>
<th>Dose/Drug Changes</th>
<th>Actions</th>
<th>Comments</th>
</tr>
</thead>
</table>
| Step 1                        | Consider doubling the patient’s current dose for 3 consecutive days or until cumulative weight loss of 5-10 lbs | Order: Electrolytes, BUN, SCr, eGFR within 7-10 days after change in diuretic dose  
• Instruct patient to call clinic if desired weight loss is achieved prior to having blood work done | Review fluid intake, should be 6-8 cups (48-64 ounces) per day  
Review Na intake, should be less than 2000mg per day |
| Weight gain > 5 lbs (2.5 kg) in one week or 4 lbs (2kg) two days | Doses > 80 mg should be split into twice daily dosing |  |
| Also assess:  
• Auscultate lungs  
• Leg edema  
• Abdominal girth increase  
• VS (P,B/P, RR, O2 sat) |  |
| Step 2 | Continue to increase Furosemide dose by 50 – 100% (Watch renal function*) | Evaluate electrolytes BUN, SCr, eGFR as ordered in Step 1  
Instruct patient to call clinic if desired weight loss is achieved prior to having blood work done  
Reorder: Electrolytes, BUN, SCr, eGFR within 7-10 days after change in diuretic dose  
Repeat Step 2 until patient at goal weight. | If volume overload persists despite optimal medical therapy proceed to Step 3.  
May need to consider down titration if:  
• symptomatic hypotension  
• If potassium >5 mmol/L  
• If SCr > 30% from baseline |
| After 3 days reassess fluid status and symptoms |  |  |
| If still > 5 lbs (2.5kg) above target weight |  |  |
| If patient at goal weight refer to Furosemide down titration guide |  |  |
| Step 3 | Add Metolazone 2.5- 5 mg 30 min prior to morning Furosemide dose. | Evaluate electrolytes BUN, SCr, eGFR  
Electrolytes, BUN, SCr, eGFR within 7-10 days after change in diuretic dose (as per patient specific Physician/NP standing order  
If volume overload persists despite optimal medical therapy proceed to step 4 | May need to consider down titration if:  
• symptomatic hypotension  
• If potassium >5 mmol/L  
• If SCr > 30% from baseline  
Instruct patient to call if desired weight loss is achieved prior to having blood work done |
| Assess fluid status and symptoms |  |  |
| If volume overload persists despite optimal medication therapy |  |  |

Continued
Step 4
Assess fluid status and symptoms

If volume overload persists despite optimal oral therapy consider:
- Refer to Internist/Cardiologist/HFC (may need intravenous Furosemide)
- Call RACE line for cardiologist support (604 696-2131 or toll free 1 877 696-2131)

May need to consider down titration if:
- If symptomatic hypotension
- If potassium >5 mmol/L
- If SCr >30% from baseline

Evaluate electrolytes BUN, SCr, eGFR

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Tachycardia with exercise</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2. Volume Depletion (Dry) (hypovolemic)</td>
<td>Weight is less than goal weight and Signs of volume depletion then reduce maintenance dose by 50%</td>
<td>Hold next dose of Furosemide</td>
<td>After 3 days reassess fluid status</td>
<td>If persistent signs and symptoms of hypovolemia</td>
</tr>
<tr>
<td></td>
<td>Signs of volume depletion • Hypotension • Tachycardia • Tachycardia with exercise</td>
<td></td>
<td>Reassess: Electrolytes, BUN, SCr, eGFR within 7-10 days after change in diuretic dose</td>
<td>Reassess fluid intake</td>
</tr>
<tr>
<td></td>
<td>Symptoms of volume depletion • Lightheadedness • Dizziness • Syncope • Very dry mouth • Constant thirst</td>
<td></td>
<td></td>
<td>May consult:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Internist, Nephrologist or Cardiologist at your site</td>
</tr>
</tbody>
</table>
| 3. Worsening Renal Function | Increase in serum creatinine by >30% from baseline  
Serum potassium >5 mmol/L  
If worsening renal function despite reduction in maintenance Furosemide consider:  
- Decrease or stop spironolactone  
  Or Metolazone  
- ensure no other nephrotoxic agents  
- Decrease ACE inhibitor/ARB dose | If patient euvoletic  
reduce maintenance Furosemide dose by 50% | After 3 days reassess fluid status, S & S of hypovolemia  
Electrolytes, BUN, SCr, eGFR within 7-10 days after change in diuretic dose | Consider consulting:  
- Internist, Nephrologist or Cardiologist at your site |
Hypertension Considerations

- Treatment with non-dihydropyridine Calcium channel blockers (eg. Verapamil, Diltiazem) are contraindicated in patients with reduced LVEF (LVEF < 40%) and must be stopped.

- Nifedipine, Amlodipine and Felodipine are useful in HF population but may complicate assessment of edema.

- Carvedilol may be the most effective beta blocker when HF and hypertension are together.
COPD Considerations

- Bisoprolol may be the most preferred Beta Blocker when Heart Failure and COPD co-exist because of its β1 selective properties.

- Minimize prn Ventolin as it causes tachycardia.

- Oral Steroids can cause fluid retention and may exacerbate heart failure.
**Angiotensin Converting Enzyme Inhibitor (ACE-I) with evidence in Heart Failure Populations**

**Angiotensin Converting Enzyme Inhibitor (ACE-I) & ARB Up-Titration Guideline**

<table>
<thead>
<tr>
<th>Signs and Symptoms Assessment</th>
<th>Dose/Drug Changes</th>
<th>Actions</th>
<th>Comments</th>
</tr>
</thead>
</table>
| Step 1                        | Begin with recommended starting dose | Baseline assessment  
  - Vital signs  
  - Renal Function  
    - Creatinine  
    - BUN  
    - eGFR | Reassess blood work every 2-4 weeks especially if you are titrating medications  
  - Electrolytes  
  - Renal function | Remember: Patients who are clinically “dry” may be more prone to renal failure when ACE/ARB dose is up-titrated  
  Closer monitoring with CKD and/or diabetes |
| Step 2                        | Increase by 50-100% every 2-4 wks | For every medication and dosage change  
  Reassess:  
  - Vital signs B/P  
  - Renal Function  
    - Creatinine  
    - BUN  
    - eGFR |  |
| Step 3                        | Increase by 50-100% every 2-4 wks | For every medication and dosage change  
  Reassess:  
  - Vital signs B/P  
  - Renal Function  
    - Creatinine  
    - BUN  
    - eGFR | Closer monitoring with CKD and/or diabetes |
### ACE-I/ARB Symptom Management Guideline

#### Considerations:
- Most of the side effects and rise in creatinine are transient and resolve within 2-4 weeks but can return with each up-titration of ACE I medication
- Patients often need support to continue medications through this phase.
- Try to titrate to maximum dose tolerated.
  - Typical patients difficult to up titrate include those with:
    - Chronic Kidney disease and Diabetes. They require very close monitoring of renal function

<table>
<thead>
<tr>
<th>Symptomatic hypotension</th>
<th>Options for Dose/Drug Changes</th>
<th>Actions</th>
<th>Comments</th>
</tr>
</thead>
</table>
|                         | **Step 1:** Reduce diuretic by 50% (per diuretic guideline) if pt euvolemic | For every medication change and dosage change Reassess:  
  - Vital signs  
  - Electrolytes  
  - Renal function  
  - Assess postural vitals | Taking other vasodilator medications at alternate times (e.g. BB at noon) |
|                         | **Step 2:** Consider alternate dosing schedules to minimize symptoms (eg. morning and bedtime) | | Taking ACE I at night (if once daily) |
|                         | **Step 3:** Decrease ACE-I by 50% | | Suggest reduction in vasodilators that are not associated with mortality benefit in patients with HF (e.g. CCB) |
|                         | **Step 4:** Decrease BB per guidelines | | Suggest to patient to rise slowly with position changes |

</table>
| Rise in creatinine | Step 1:  
Consider reducing ACE-I by 50% | Reduce until stable renal function | Monitor creatinine, allow a 30% increase in baseline  
If diabetic, may have to stop metformin once Cr > 200 umol/  
Normal Creatinine levels |
|------------------|----------------------------------|----------------------------------|-------------------------------------------------|
|                  | Step 2: After one week  
If Cr remains increased consider reducing ACE-I by 50% |                                  |                                                 |
|                  | Step 3:  
If Cr remains elevated ≥200 umol/L consider D/C ACE-I and start Nitrate/Hydralazine |                                  |                                                 |
| Hyperkalemia     | Step 1:  
D/C spironolactone  
Consider reducing ACE-I by 50% | Assess if patient is taking Na substitute as they can be high in K+  
Assess if pt is eating food high in K+  
Asses if patient is taking NSAID’s and if they are D/C | Normal K+  
3.5-5 mmol/L  
Assess for S& S of Hyperkalemia  
Caution in clinical conditions which could lead to dehydration (eg. intercurrent sepsis or infection) |
|                  | Step 2: after 1 week  
If K+ remains elevated reduce by another 50% | If K+ > 6.0 mmol/L then direct to acute care facility. |                                                 |
|                  | Step 3:  
D/C ACE |                                  |                                                 |
Commonly used Vasodialatators

<table>
<thead>
<tr>
<th>Vasodialator</th>
<th>Starting dose</th>
<th>Maximum total daily dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hydralazine</td>
<td>37.5 mg TID or QID</td>
<td>75 mg TID or QID</td>
</tr>
<tr>
<td>Isorbide dinitrate OR Nitro patch</td>
<td>20 mg TID</td>
<td>40 mg TID</td>
</tr>
<tr>
<td></td>
<td>0.2mg/hr – 0.4mg/hr for 12hrs/per day</td>
<td>0.6mg/hr-0.08mg/hr for 12 hrs per day</td>
</tr>
</tbody>
</table>

A combination of Hydralazine and Isorbide dinitrate is recommended:
- As part of standard therapy in addition to beta blockers and ACE inhibitors for African Americans with HF and reduced LVEF NYHA III or IV HF
- For patients who are unable to tolerate ACE/ARB.

Has no effect on renal failure Does not cause Hyperkalemia

Hydralazine and Nitrates should be used concurrently
Should not be used in patients on pulmonary vasodilators such as sildenafil or tadalafil

Nitrates require a drug free period to decrease tolerance (eg. Remove nitro patch for 12 hrs, or space Isorbide so there is a 12 hr nitrate free period)

Vasodialator Up Titration & Intervention Guidelines

Perform telephone or in clinic assessment 3-4 days after medication changes, may need to check blood work within 7-10 days depending on what other medications your patient is taking

<table>
<thead>
<tr>
<th>S &amp; S Assessment</th>
<th>Dose/Drug Changes</th>
<th>Actions</th>
<th>Comments</th>
</tr>
</thead>
</table>
| Step 1           | Commence vasodilator therapy per recommended starting does (see above table) | Assess vital signs, watch for Signs
- Hypotension
- Tachycardia Symptoms
- Dizziness
- Lightheadedness
- Syncope/Presyncope
- Headache Continue to also assess HF S & S:
- Auscultate lungs
- Leg edema
- Abdominal girth increase
- Weight watch for gain of > 5 lbs (2.5 kg) in one week or 4 lbs (2kg) two days | Continue with patient self management education:
- Review fluid intake, should be 6-8 cups (48-64 ounces) per day
- Review Na intake, should be less than 2000mg per day |

| Step 2           | Continue to increase dose by 50 – 100% | Assess vital signs, watch for Signs
- Hypotension
- Tachycardia Symptoms
- Dizziness
- Lightheadedness
- Syncope/Presyncope
- Headache | May need to consider down titration if:
- symptomatic hypotension
- headache
Continue to also assess HF S & S:
- Auscultate lungs
- Leg edema
- Abdominal girth increase
Weight watch for gain of > 5 lbs (2.5 kg) in one week or 4 lbs (2kg) two days |

|                              | other heart rate lower         |                                               |                                               |
|                              | medications (eg, digoxin,      |                                               |                                               |
|                              | antiarrhythmics, CCB)          |                                               |                                               |
|                              | Step 2:                        |                                               |                                               |
|                              | If S & S persist               |                                               |                                               |
|                              | consider reducing BB by 50%    |                                               |                                               |
|                              | Step 3:                        |                                               |                                               |
|                              | If S & S persist               |                                               |                                               |
|                              | D/C BB and/or reducing it      |                                               |                                               |

Consider holter monitor for more accurate assessment of 24 hr HR control
Give each down titration one week to see if symptoms resolve
If profound symptomatic Bradycardia EHS transfer to acute care facility
**Indication for referral**

To a Cardiologist/Internist:

- When healthcare provider needs further direction on how to medically manage the patient
- Advanced functional symptoms or signs of heart failure despite maximum medication therapy

To a Heart Function Clinic:

- They have had recent or repeated admissions to hospital
- Assessment of ASYMPTOMATIC left ventricular dysfunction
- Chronic heart failure management including lifestyle management skills and consideration for advanced therapies including defibrillator/cardiac resynchronization therapy
- Heart Failure with persistent symptoms but not decompensated,
- New diagnosis of heart failure and STABLE
- New diagnosis of heart failure and UNSTABLE
  - Post MI heart failure; hospitalization HF; worsening HF

Patients experience long term benefits associated with referral to a Heart Function Clinic’s as they offer inter-professional collaborative HF care, evidenced based medical therapy, ongoing close monitoring and individualized interventions tailored to the specific patients needs.

Patients with NYHA I-III should be referred to a cardiac rehabilitation program
Heart Function Clinic Referral Form

<table>
<thead>
<tr>
<th>*Reason For Referral</th>
<th>*Care Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>□ Assessment of ASYMPTOMATIC heart failure (HF)</td>
<td>□ Shared care: (GP and Clinic physician/NP)</td>
</tr>
<tr>
<td>□ Chronic heart failure management</td>
<td>□ HF physician/NP to stabilize and optimize medication therapy</td>
</tr>
<tr>
<td>□ Heart Failure with symptoms but Not decompensated,</td>
<td>□ Optimize patient self-management/ education ONLY</td>
</tr>
<tr>
<td>□ New diagnosis of heart failure and STABLE</td>
<td>□ Advice only on care management</td>
</tr>
<tr>
<td>□ New diagnosis of heart failure and UNSTABLE</td>
<td></td>

*Specific question referring provider would like answered?

*Primary Language Spoken If not English please ensure there is someone with the patient who can speak English

* Please include/or attach a complete list of all medications your patient is taking

*Co-morbidities:
- □ Diabetes,
- □ Renal
- □ Hypertension
- □ Angina
- □ Thyroid Disease
- □ Respiratory
- □ Arrhythmias
- □ CABG
- □ TIA/CVA
- □ Arthritis
- □ Malignancy
- □ Other specify ___________

*Please attach available/relevant cardiac investigation results

For example: Echo, MIBI, MUGA, ECG, Angiogram, CXR, consultation notes, Blood work (BNP, Lytes, etc.)

*Acknowledgement of Referral (Will be completed by HFC staff)
- □ Our office will make an appointment with the heart function DR/NP in the next _______________________Week(s)
- □ Your patient is booked to be seen by the heart function Nurse on ____________________________
- □ We require additional information ___________________________________________________________
  - o Before we can book the patient
  - o Prior to the patient’s appointment

*Referring Physician/ NP ____________________________ *Date: ____________________________

To expedite care PLEASE ensure ALL aspects of this form are completed
# Digoxin

<table>
<thead>
<tr>
<th>Starting dose</th>
<th>Maximum total daily dose</th>
<th>Monitor Digoxin levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0625mg PO daily</td>
<td>0.25mg PO daily</td>
<td>Normal ranges= 0.65-1.0 nmol/L</td>
</tr>
</tbody>
</table>

- 8-12 hrs. post starting of dose
- Then every 5-7 days after dose adjusted or when there is an abrupt change in renal function

Has not shown any benefit on mortality and morbidity but has shown benefit on Quality of Life

Can be used with a patient who has:
- Been diagnosed NYHA Class I-III
- An Ejection Fraction (EF) of <40% (Systolic Heart failure) or in patients with diastolic heart failure and concomitant atrial arrhythmias (e.g. atrial fibrillation/atrial flutter)

**Use with Caution:** in the frail elderly, patients with impaired renal function, patients with low BMI, women, patients with increased K+

There could be *dangerous interaction* with verapamil and erythromycin

**REMBEMBER:** Amiodarone increases plasma levels of digoxin so use with caution and monitor digoxin levels more closely

Digoxin is primarily cleared by the kidneys. When someone has impaired renal function, monitor the renal function and potassium levels more closely since kidney dysfunction and low levels of potassium can result in symptoms of digoxin toxicity

**Not recommended** in patient with EF ≥40% (Preserved systolic Heart failure [diastolic heart failure]) and with normal sinus rhythm (NSR)

In patients with renal dysfunction it may take 15-20 days to reach therapeutic levels

**Signs & Symptoms** of Digoxin toxicity:
- A:V heart blocks
- Ventricular tachycardia, ventricular fibrillation
- PR interval prolongation
- Amblyopia,
- Nausea, vomiting, diarrhea,
- confusion, drowsiness,
**Aldosterone Antagonists (with evidence in heart failure)**

<table>
<thead>

<tbody>
<tr>
<td>Spironolactone</td>
<td>12.5mg-25mg</td>
<td>25 daily</td>
</tr>
</tbody>
</table>
| Eplerenone (not covered by MSP) | 25 mg daily | 50 mg daily
Within 4 weeks of starting the dose |

Spironolactone may be used in patients with NYHA III-IV heart failure on optimal medical therapy, while Eplerenone has shown benefit in patients with NYHA II symptoms.

Patients should be on maximum medical therapy including ACE/ARB and Beta Blocker prior to initiation of an aldosterone antagonist.

**Aldosterone Antagonists have the potential to effect kidney function and increase serum Potassium (K+)**

Gynecomastia is known to occur in up to 5-10% of males treated with spironolactone. Gynecomastia is decreased with eplerenone

Aldosterone antagonists are not recommended when creatinine is > 200umol/L, Creatinine clearance <50ml/min; serum potassium is > 6mmol/L, Severe hepatic impairment, potassium supplements or CYP34 inhibitors or in conjunction with other potassium-sparing diuretics

Once clinically stabilized and on maximum Aldosterone Antagonist therapy assess K+, SCr, and eGFR q 4 weeks until these laboratory values are stable for three months.

**Aldosterone Antagonist Titration & Intervention Guidelines**

Perform telephone or in clinic assessment of fluid status 7 days after medication changes, and check blood work within 7 days after medication changes

<table>
<thead>
<tr>
<th>Signs and Symptoms Assessment</th>
<th>Dose/Drug Changes</th>
<th>Actions</th>
<th>Comments</th>
</tr>
</thead>
</table>
| **Step 1** NYHA functional class III-IV symptoms and on maximal tolerated doses of ACE/ARB and BB | See above chart for starting dose | Aldosterone Antagonists have the potential to effect kidney function and increase serum Potassium (K+):
BE AWARE OF K+ LEVEL PRIOR TO STARTING THE ALDOSTERONE ANTAGONIST
• Order: Electrolytes, BUN, SCr, eGFR within 7 days after change in dose | Things to review with your patient:
• fluid intake, should be 6-8 cups (48-64 ounces) per day
• Na intake, should be less than 2000mg per day
• Instruct pt to decrease dietary potassium intake
• Stop K+ supplements in favor of aldosterone antagonists |
| **Step 2** After 7 days reassess fluid status, K+ and symptoms If wt still > 5 lbs (2.5kg) above target weight and K+ not elevated If patient at goal weight may consider down titration of Aldosterone antagonist Continue to increase Aldosterone Antagonist to maximum doses based on renal function and K+ | Keep a close watch on renal function, SCr, K+
• Evaluate electrolytes BUN, SCr, eGFR
• after change in medication dose | May need to consider down titration if:
• symptomatic hypotension
• If potassium increases 5.5-5.9 mmol/L
• If SCr > 30% from baseline |

Continued
| **Eplerenone:** |
| **If K+ < 5mmol/L increase starting does by 50%** |
| **If K+ 5.0-5.4 maintain starting does** |
| **If K+ 5.5-5.9 decrease dose to:** |
| • 50mg daily to 25mg daily |
| • 25mg daily to 25mg every 2nd day |
| • 25mg every 2nd day to HOLD |
| **If K+ > or equal to 6** |
| • HOLD dose |

| **Spironolactone** |
| **If K+ is within normal range increase to** |
| • 25mg daily |

| **Step 3** |
| **Assess fluid status, K+ and symptoms** |
| **If volume overload persists despite optimal medication therapy** |

| **Continue up titration per Step #2** |
| • Evaluate Electrolytes, BUN, SCr, eGFR within 7 days after change in medication dose |

| **May need to consider down titration if:** |
| • symptomatic hypotension |
| • If potassium 5.5-5.9 mmol/L |
| • If SCr > 30% from baseline Instruct patient to call if desired weight loss is achieved prior to having blood work done |

**IF S&S of heart failure persist AFTER MAXIMUM MEDICATION THERAPY YOU MAY NEED TO CONSULT AN INTERNIST OR CARDIOLOGIST**
REFERRAL GUIDELINES FOR ICD & CRT CONSIDERATION

SECONDARY PREVENTION
Previous Cardiac Arrest, VF or Sustained VT (induced or spontaneous and not due to a reversible cause)

PRIMARY PREVENTION & CRT PATIENTS (Ischemic & Non-Ischemic)

OPTIMAL MEDICAL THERAPY (OMT)
Patient is receiving OMT for a minimum of 3 months (Medications may include: Beta Blockers, ACE inhibitors, Diuretics, Statins)

RECENT LOW LVEF* MEASUREMENT
Measured within past 6 months and 30 days post MI or 80 days post revascularization procedure

IF admitted, do not discharge patient

ICD
LVEF ≤ 30%**
Non-Ischemic Cardiomyopathy with persistently low LVEF for at least 9 months
NYHA Class II or III
REFER FOR ICD CONSIDERATION, UNLESS CONTRAINDICATED

CRT2
LVEF ≤ 35%**
Cardiomyopathy with QRS ≥ 120ms
NYHA Class II - IV
REFER FOR CRT CONSIDERATION, UNLESS CONTRAINDICATED

CAD or Post MI
NYHA Class II or III

2 Canadian Cardiovascular Society Consensus Conference Heart Failure Management 2006 CAN J Cardiol Vol 22 No1 January 2006
* LVEF – Left Ventricular Ejection Fraction
** For appropriate patients, EF of 31% to 35% will also be considered per CCS/CHRS Recommendations

Sept 2011: Adapted from Medtronic of Canada Ltd’s Referral Guidelines for ICD and CRT Consideration

Continued
**SUDDEN CARDIAC DEATH (SCD) FACTS**

❤ SCD is a leading cause of death in Canada, claiming 45,000 lives a year – more than lung, colorectal, breast and prostate cancers combined ¹, ²

❤ Only 5% of SCD victims survive an out of hospital cardiac arrest ³ – defibrillation within 6 minutes is critical with each additional minute of delay reducing the change of survival by 7-10% ⁴

❤ Randomized clinical trials have not shown that antiarrhythmic drug therapy can effectively reduce mortality in heart failure patients ⁵, ⁶

❤ Within an ICD, over 95% of SCD victims survive ⁷

RACE
RAPID ACCESS TO CONSULTATIVE EXPERTISE

RACE means timely telephone advice from specialists for family practitioners, Community Specialists or Housestaff, all in one phone call.

Monday to Friday 0800-1700

Local Calls:  604-696-2131
Toll Free:  1-877-696-2131

Speak to a:
- Nephrologist
- Heart Failure Specialist
- Cardiologist
- Respirologist
- Endocrinologist
- Cardiovascular Risk & Lipid Management Specialist
- General Internist
- Psychiatrist
- Geriatrician
- Gastroenterologist

Provincial Services Include:
- Chronic Pain
- Rheumatology

RACE provides:
- Timely guidance and advice regarding assessment, management and treatment of patients
- Assistance with plan of care
- Learning opportunity – educational and practical advice
- Enhanced ability to manage the patient in your office
- Calls returned within 2 hours and commonly within an hour
- CME credit through “Linking Learning to Practice”
  http://www.cfpc.ca/Linking_Learning_to_Practice/

RACE does not provide:
- Appointment booking
- Arranging transfer
- Arranging for laboratory or diagnostic investigations
- Informing the referring physician of results of diagnostic investigations
- Arranging a hospital bed.

Unanswered Calls?
If you call the RACE line and do not receive a call back within 2 hours – call the number below. All unanswered calls will be followed up.

For questions or feedback related to RACE, call:
604-682-2344, extension 66522 or email mwilson@providencehealth.bc.ca

This work is made possible through a partnership between the Shared Care Committee and Providence Health Care in collaboration with Vancouver Coastal Health.
